

These tracings were made on letter-sized paper (11" x 8.5") and scanned. They should be true-to-size.

Each stimulus was made from clear acrylic. The first stimulus set looks to be cut using a band saw. Stimuli sets 2-end are laser cut from 1/8" clear acrylic. The first set of stimuli had different thicknesses (indicated below each tracing).

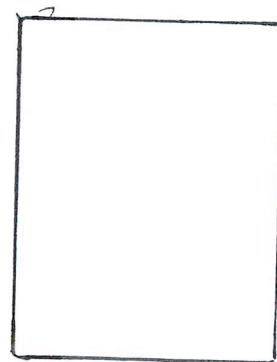

The standard stimulus is the leftmost tracing. It is typically marked with a red sharpie on a short (about 1") section on a side of the stimulus, so that it can be differentiated from the other stimuli in the set. Obviously, the participant should have no vision or be blindfolded, otherwise this cue would be apparent.
